Gdańsk, Dec. 1-4, 1949 (Materiały przekazane na VI Zjazd
Naukowy PZITB - Polski Związek Inżynierów i Techników
Budowlanych w Gdańsku 1-4 grudnia 1949) (in Polish). Edition
of the Polish Ministry of Buildings No. 37, III. Wydawnictwo
Ministerstwa Budownictwa No. 37, 1949 III.

1116. Wierzbicki, W., The buckling of three-pinned arches,
228-238.
Work has in view an approximate calculation of the critical
force in a three-pinned arch of a small center rise and in which, as
it is generally known, symmetrical form of buckling takes place.
As in his other works discussing two-pinned and rigid arches,
author applies the finite differences calculus.
J. Muterlich, Poland

<p>WIERZBICKI, W. AMR</p>		<p>30</p>	
<p>WIERZBICKI, W. Structural mechanics, 4th ed. (in Polish), Warsaw, Students' Publ. Co-operative, 1949, xv + 600 pp.</p>		<p>This very good handbook is written chiefly for students of polytechnical schools. Conforming to the curricula of these schools, it is limited to the theoretical problems and calculations of structures and does not include descriptions of the structures themselves, as is often done in English handbooks. The main object of the book is to teach, but it also contains a more comprehensive discussion of those scientific problems which were the object of the author's studies; e.g., calculation of elastic arches based on the development of the theory of the least squares; relation between the static pressure and aerodynamic pressure; a comprehensive discussion of buckling; the theory of polygonal bars, etc. Latest literature on the subject is given in footnotes. The plan of the work is as follows: A. Plane systems and torsion of straight bars: (a) Full systems, (b) framework systems, (c) suspension chains and carrying lines, (d) retaining walls and gravity dams. B. Space systems: (a) Full systems, (b) framework systems. There are also chapters on safe stress, strain energy, and dynamic strength. An index of structural mechanics terms in Polish, French, English, German, and Russian is appended.</p>

Wierzbicki W., Prof. Dr. "Permissible Tangential Stress in Steel Constructions."
(W sprawie dopuszczalnych naprezen stycznych w konstrukcjach stalowych). Inzynieria
i Budownictwo, No 1-2, 1950, pp. 38-44, 3 figs., 1 tab.

The necessity for basing safety factors on computations and statistics, free from the subjectiveness of the authors of building regulations. Bodies of uniform resistance; hypothesis of maximum unit elongation and of maximum stress. The value of permissible tangential stress determined as a result of applying the hypothesis of maximum unit elongations. The author proves that in the majority of materially important cases it would be dangerous to increase the permissible tangential stress beyond the values determined by the hypothesis of maximum tangential stress. The problem of permissible tangential stress is dealt with in this article, from the point of view of computation and statics, in a novel and original manner.

SO: Polish Technical Abstracts No. 2, 1951

[illegible]

α , then $\Omega' = \pi\alpha$, will indicate probability that the stress will not exceed the limiting value of σ_c . For some stresses we have:
 $\tau_c = \tau_0 (1 + 2\alpha_c)$. Furthermore, there were established the limiting equations for reduced stress σ_c' , as well for hypothesis of maximum strain as for hypothesis of maximum shear, taking into consideration increase of the stress in respect to theoretical formulae. From equation (1) there are calculated, for $p = 0.5025$, the stress σ_c and τ_c and the ratio k_1/k_2 . The calculations were done for the standard deviation 2%, 4%, and 6% and it was found that for the hypothesis of the maximum strain $k_1 = 0.607k_2$, $k_1 = 0.497k_2$, and $k_1 = 0.402k_2$, respectively, while for the hypothesis of the maximum shear independently from α , it gave a constant value $k_1 = 0.4k_2$. Hence the conclusion is that, for safety, the stress stresses should be not higher than $k_1 = 0.4k_2$, or that basic hypothesis should be hypothesis of maximum shear.

3000. Wierzbicki, W. The meaning of chance in the problems of strength of materials (in Polish), Jubilee book edited in honor of Prof. M. T. Huber, Gdansk-Politechnika, 133-452, 1950.																																																																							
Because of many unknown factors, chance affects each result in a strength-of-material test, and hence, calculations for strength contain inevitable errors. In contrast to the subjective manner in which designers have handled the element of chance in strength-of-material problems, author introduces his method of objective determination of safety factors, based on the calculus of probability and on mathematical statistics. To describe numerically the gradient of safety, such as to insure a given structure, author bases his theory on a value p which expresses the probability that the structure will not fail (index of safety). The value p should be determined from statistics on failures of similar structures or by comparison with the probability of such events as fires, floods, etc.																																																																							
Author determines the factor of safety n based on the index of safety p from the equation $\Omega_1 \cdot \Omega_2 \cdot \Omega_3 = p$, which is valid for cases of large probabilities, where Ω_1 is the probability that the hypothesis, on which the calculation is based, is true; Ω_2 is the probability that dimensions and loads assumed in calculations are real probabilities, are determined by means of Gauss' curve or from tables of Laplace's function. Author gives some examples of determining the values n and p and also shows the advantages of using this method to determine the allowable working shear stress in steel structures [see AMR 4, Rev. 1579], and also for calculating the cable in suspension bridges [see Publ. int. Assoc. Bridge Struct. Engng., 1949]. K. Zarankiewicz, Poland

• Wierzbicki W. On the Origin of Buckling in Straight Rods.
"O powstawaniu wyboczenia prętów prostych". Rozprawy Inżynier-
skie (PAN), Warszawa, 1934, 29/N, 160, 65 pp., 70 figs.

By means of a study of the problems of buckling (distortion) on the basis of observations and direct analysis on the one hand, and by means of comparing the phenomenon with its models and with eccentric compression (to which it is closely connected) on the other, the author comes to the following general definition: buckling is an example of instability or pseudo-instability of a straight rod compressed axially at a definite value of longitudinal force, called the critical force. The essence of a buckling phenomenon, models of a buckling phenomenon and also the relation of buckling to eccentric compression are described.

Wierzbicki W. Problems in the Theory of Stresses, Vibrations and
Bulges

624.042

„Zadania z teorii naprężeń, wyboczenia i drgań”. Warszawa, 1953.
PWT, 160, 167 pp. 124 figs.

The book contains the following chapters: 1) Stresses (A. Normal stresses. B. Tangent stresses. C. Composite stress conditions). 2. Bulges. 3. Vibrations. Most of the problems in Chapter 1 are intended for the junior course of faculties connected with building (the so-called engineers' course); on the other hand, most of the problems in Chapters 2 and 3, are for the senior, or Bachelor, courses. In Chapter 2 and 3, a good deal of space is devoted to the approximate methods of determining critical forces and resonance-vibration frequencies. Only in this way has it been possible to increase the variety of problems concerning bulges, and the theory of vibrations, without exceeding the scope of a collection of problems and without reducing the calculations to purely numerical operations, performed by means of ready-made formulas.

Zadania z teorii naprężeń, wyboczenia i drgań (Problem in the Theory of Tensile Stresses, Column Theory and Vibration) 2d ed. Warsaw, PWN, 1958. 167 p. 5,200 copies printed.

No additional contributors mentioned.

PURPOSE: The problems presented in this book are intended for students of advanced courses in structural engineering (construction mechanics) and for construction engineers.

COVERAGE: The book consists of 120 problems with solutions on stresses, column buckling and vibrations met in construction engineering. The book should be considered as a part of the same author's earlier publications: Mechanika budowli (Construction Mechanics) and Wstęp do dynamiki budowli (Introduction to Construction Dynamics, 1959). Problems 59 and 60 are based on solutions suggested by Professor Felix Jasinski and taken from his well-known book Badania nad sztywnością prętów ściskanych (Investigation of Rigidity of Com-

Title : Bone Marrow Disorder as a Sequela of Occupational Poisoning with Lead Compounds.

Orig Pub : Med. pracy, 1955, 6, No 4, 243-248

Abst : Description of a rare case of fatal poisoning with Pb, involving total impairment of bone marrow, in a 17 year old painter who worked in a building with paints containing Pb. Ancillary investigations revealed damage to erythro-, leuco- and thromboclastic system. Porphyrinuria and increased excretion of Pb with the urine in combination with blue line on the gums confirmed the diagnosis of Pb-intoxication. It is assumed that severe disruptions of organic functions were caused by individual, increased sensitivity to Pb.

"Joint Lesions as the Direct Cause of Inability to Mate in a Boar."

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 18, No 9, Sep 62, pp 542-544.

Abstract: Boar impotence as a result of lesions of the joints has been described in Sweden, and confirmed on animals imported to Poland. The author describes the findings of such an investigated case in detail. He points to the importance of bone examination of imported animals, and the significance of this problem both for animal breeding and for medicine. Three references, one Swedish, one English, and one Polish.

Wierzchowska Z. Tectonical Earthquakes in Silesia and their Relation to Rockbursts in Mines.

"Tektoniczne trzęsienia ziemi na Śląsku i ich związek z łapaniem w kopalniach", Przegląd Górniczy, No. 1, 1935, pp. 29-31, 2 figs.

Investigation by the Chief Institute of Mining, which controls several seismographical stations, have revealed that there is a great frequency of local tremors in Upper Silesia. The epicentres of these tremors are, as determined by K. Janczewski's method, located several kilometres deep and occur in the western part of the coal-basin in the vicinity of the Michałowice-Orłowa tectonical distortions. These earthquakes contribute to the occurrence of rockbursts in collieries by upsetting the delicate equilibrium of the undermined terrain.
